

Green Energy Careers

Guiding question: What is the state of the green energy sector, what careers exist, and what skills are useful to be involved in the industry?

VEEP's Green Energy Careers workshop highlights the tools, concepts and pathways that lead to careers in renewable energy generation and/or energy efficiency. It is designed for high schools or career and technical education centers.

Workshops with a focus on renewable energy generation give students the opportunity to manipulate photovoltaics and wind generators to optimize design and installation. Workshops with a focus on energy efficiency introduce tools and concepts related to thermal and lighting efficiency. Students are introduced to a variety of green energy careers, including the pathways, position titles, duties, skill sets, and compensation for each. An information packet on certification, licensure and education programs as well as more in depth information for green energy career paths will be left with participating programs to facilitate follow-up for any interested students.

This 2.5 to 3-hour workshop can be delivered in two separate sections, or chosen as a 90-minute session focusing on either renewable energy or energy efficiency.

Contact us at info@veep.org or 802-552-VNRG for more information on bringing this workshop into your classroom.
